1. Introduction

The Statistics Centre – Abu Dhabi (SCAD) is the official entity responsible for producing and publishing energy statistics. These statistics contribute to monitoring and analyzing energy indicators related to various sources such as electricity, natural gas, crude oil, and petroleum products. The data provides a scientific foundation for analyzing economic and environmental trends and supports the formulation of public policies and future planning, thereby enhancing the efficiency and sustainability of energy resource management.

The energy statistics methodology is based on applying the latest international standards in data collection and analysis to ensure accuracy and comprehensiveness of results. Data is collected from a variety of sources, including surveys conducted by the Centre, as well as administrative data obtained from government entities and companies. These data are analyzed to provide an integrated view of energy sector, contributing to more effective energy policies and supporting decision-makers in future planning to achieve sustainable development in the energy sector.

2. Statistical information

2.1. Importance and Objectives

Energy statistics are a fundamental tool for supporting decision-making across various areas of the energy sector, as they provide an accurate knowledge base used in strategic planning and policy formulation. These statistics contribute to monitoring and analyzing indicators related to the production and consumption of various energy sources.

The main objectives of energy statistics are as follows:

- Collect the necessary information on energy generation and consumption to conduct environmental accounting and compile energy indicators.
- Provide energy indicators to support decision-makers and government entities in the preparation and evaluation of public policies and strategies.
- Providing reliable indicators used to monitor energy consumption efficiency and identify areas for improving the sustainable management of resources.
- Strengthening transparency and data accuracy in the energy sector, contributing to the establishment of a reliable information base to support future studies and research.

2.2. Key Outputs

Energy statistics provide an integrated system comprising (23) statistical indicators covering the electricity, oil, and gas sectors. These include data on energy production and consumption, the consumption of fossil fuels, and the production of crude oil and refined petroleum products. They also include indicators on electricity consumption at both the individual and household levels.

In addition, the indicators cover household energy expenditure and efficiency, access to electricity services, and the reliance on clean fuels and technologies. These statistics provide an accurate and reliable database that contributes to supporting evaluation processes, strategic planning, and the development of relevant public policies. The list of indicators is presented in Annex Table (1).

2.3. Concepts and definitions

Clear and precise concepts and definitions ensure consistency in interpretation and application across various energy statistics. These concepts form the foundation for data collection and analysis. The concepts and definitions adopted by the Abu Dhabi Statistics Center, which align with internationally recognized terms, are used. They include the following:

- **Electricity consumption:** It refers to the total amount of electrical energy used by end users over a given period.
(Source: International Energy Agency (IEA))
- **Electricity:** A type of energy, which is the process of electrons flow in electrical conductors and the effects that result from this flow, and it is the second source of energy at the present time. It is obtained from the conversion of other sources of energy, such as: coal, natural gas, and petroleum. Electric energy can be used only after converting it to other sources of energy such as: thermal and mechanical.
(Source: Abu Dhabi Reference Data (ADRD) Version 1.1.1)
- **Energy savings:** A reduction in the amount of electricity used by end users as a result of participation in energy efficiency programs and load management programs.
(Source: US Energy information administration)
- **Residential energy:** The energy used by households for space heating and cooling, water heating, lighting, appliances, electronic devices and cooking.
(Source: International Energy Agency's (IEA))
- **Household expenditure:** The expenditure incurred by resident households on goods and services for the satisfaction of individual needs and wants, including both monetary outlays and the imputed value of goods and services received in kind (such as employer-provided housing or food).
(Source: System of National Accounts 2025)

- **Household income:** It consists of all receipts whether monetary or in kind (goods and services) that are received by the household or by individual members of the household at annual or more frequent intervals but excludes windfall gains and other such irregular and typically one-time receipts. (Source: OECD Framework for Statistics on the Distribution of Household Income, Consumption and Wealth)
- **Crude oil:** It is a mineral oil of natural origin comprising a mixture of hydrocarbons and associated impurities, such as Sulphur. It exists in the liquid phase under normal surface temperature and pressure and its physical characteristics (density, viscosity, etc.) are highly variable. This category includes field or lease condensate recovered from associated and non-associated gas where it is commingled with the commercial crude oil stream. (Source: Energy Statistics Glossary)
- **Refined petroleum products:** They include but are not limited to gasoline, kerosene, distillates (including No. 2 fuel oil), liquefied petroleum gas, asphalt, lubricating oils, diesel fuels, and residual fuels. (Source: EUROSTAT Glossary)
- **Refinery input from crude oil:** Total crude oil (domestic plus foreign) input to crude oil distillation units and other refinery processing units (cokers, etc.). (Source: US Energy Information Administration)
- **Combustion:** The primary means of harnessing the chemical energy in combustible fuels. Uses heat or pressure to activate a chemical reaction that releases more energy than used as an input. Combustion can occur in boilers, turbines, engines and other devices. Fuel cells, however, do not operate via combustion but via electrochemical oxidation. (Source: International Energy Agency's (IEA))
- **Fossil fuels:** Fossil fuels are coal, oil and natural gas. They are derived from the remains of ancient plant and animal life. (Source: Energy Statistics Glossary)
- **Diesel Oil:** A refined petroleum product used primarily as fuel in diesel engines. It includes both light and heavy gas oils derived from atmospheric and vacuum distillation processes of crude oil. (Source: OECD, Energy Statistics)
- **Gasolines:** Complex mixtures of volatile hydrocarbons distilling between approximately 25°C and 220°C and consisting of compounds in the C4 to C12 range. (Source: International Recommendations for Energy Statistics. UNSD, Series M No. 93, 2018)
- **Natural gas:** Natural gas comprises gases, occurring in underground deposits, whether liquefied or gaseous, consisting mainly of methane. It includes both "non-associated" gas originating from fields

producing only hydrocarbons in gaseous form, and "associated" gas produced in association with crude oil as well as methane recovered from coal mines (colliery gas).

(Source: OECD)

- **Other fuels:** Fuels that are not specified under standard categories, including unconventional fuels or those produced from novel sources. Examples include synthetic fuels and blends.

(Source: UNSD, International Recommendations for Energy Statistics)

2.4. Classifications and Standards applied

The purpose of using these sources is to ensure the adoption of accurate and standardized terms and criteria in classifying and documenting data related to energy statistics, guaranteeing comparability and alignment with the best local and international practices.

- **International recommendations for energy statistics¹:** is a comprehensive framework that provides internationally agreed guidelines for collecting, compiling, and disseminating energy statistics across countries of all development levels. IRES was developed by the United Nations Statistics Division (UNSD) in cooperation with international expert groups and adopted by the UN Statistical Commission.
- **Energy Statistics Handbook²:** The Energy Statistics Manual, published by the International Energy Agency (IEA) and Eurostat, is a practical guide designed to introduce the fundamentals of energy statistics in a straightforward, accessible format. Written in a question-and-answer style, it covers core topics such as definitions, units of measurement, data presentation, and methodology, ensuring key concepts are understandable to both beginners and practitioners in the field. The manual contains chapters on the fundamentals of energy statistics and detailed sections on each major fuel type—electricity and heat, natural gas, oil, solid fossil fuels, manufactured gases, renewables, and waste.
- **Energy statistics Compilers' Manual³:** United Nations Energy Statistics Handbook is a practical guide designed to assist countries in the collection, analysis, and dissemination of energy statistics according to international standards. It serves as a companion to the International Recommendations for Energy Statistics (IRES) by providing detailed explanations, practical instructions, and extensive country examples on how to implement IRES recommendations. It covers topics such as

¹ <https://unstats.un.org/unsd/energystats/methodology/documents/IRES-web.pdf>

² <https://iea.blob.core.windows.net/assets/67fb0049-ec99-470d-8412-1ed9201e576f/EnergyStatisticsManual.pdf>

³ https://unstats.un.org/unsd/energystats/methodology/documents/ESCM_2017850E.pdf

classifications, data sources, compilation methods, energy balances, data quality assurance, and data dissemination, to help practitioners build or improve consistent, reliable, and internationally comparable energy statistics programs.

- **Energy Efficiency Indicators: Fundamentals on Statistics⁴** : is a practical methodological guide developed by that explains how to develop, collect, and use energy efficiency indicators based on reliable statistical data. The publication provides internationally recognized approaches for measuring energy efficiency across sectors such as residential, transport, industry, and services, helping policymakers and statistical agencies evaluate energy performance, monitor efficiency improvements, and support evidence-based energy policies.
- **Global indicator framework for the Sustainable Development Goals (SDG 7-1-1)⁵** : The document on the indicator 7.1.1 measures the proportion of the population with access to electricity, tracking progress toward universal, reliable, and modern energy services by 2030. The document explains the sources of data and how they are compiled and describes the methodology and classification of the indicator. It also highlights how the information can be used to identify gaps, guide planning, and support efforts toward equitable access to energy for sustainable development.
- **Global indicator framework for the Sustainable Development Goals (SDG 7-1-2)⁶** : The document on the indicator 7.1.2 measures the proportion of the population with primary reliance on clean fuels and technologies for cooking, heating, and lighting. The document explains the sources of data and how they are compiled, describes the methodology and classification of this indicator, and emphasizes how the results support monitoring inequalities and guiding policies to extend equitable access to modern energy services.
- **The International Standard Industrial Classification of Economic Activities – Rev. 4 (ISIC 4)⁷** : The document sets out a unified international classification system for economic activities. It provides a coherent structure of categories based on agreed-concepts, definitions and rules, through which statistical data on production, employment and other economic phenomena can be collected, compiled and compared globally. The revision enhances relevance by recognizing newly emerging industries and improves international comparability as well as national classification alignment.

Abu Dhabi Reference Data⁸ : A strategic project by the Abu Dhabi Statistics Center aimed at establishing a unified, systematic, and technically efficient framework for governing and managing reference data across the Emirate of Abu Dhabi. It seeks to provide a standardized foundation for data collection, classification, organization, and analysis. This project enhances data integration, comparability, and the production of accurate and reliable statistical indicators, while fostering collaboration among all relevant entities within the Emirate's data ecosystem).

2.5. Available Breakdown

Statistics Centre – Abu Dhabi publishes energy statistics according to the following levels:

Fossil fuel combustion – gasoline:

- Sector

Fossil fuel combustion - diesel:

- Sector

Fossil fuel combustion - natural gas:

- Sector

Fossil fuel combustion – other:

- Sector

Production of refined petroleum products:

- product type

The main variables are classified as follows:

Sector consumes fossil fuel:

- Construction
- Trade
- Services
- Transport and Storage
- Industrial

Product type: Production of refined petroleum products by product type

- Heavy fuel Oil / S.R.Residue
- Liquid Sulphur

⁸ <https://scad.gov.ae/web/guest/abu-dhabi-reference-classifications>

- LPG
- Naphtha
- Jet Fuel / Kerosene
- Gas Oil / Diesel
- Lubricants
- Unleaded Gasoline
- Other

(Note: The main variables are classified according to the source).

2.6. Statistical population

The statistical population for energy statistics in the Emirate of Abu Dhabi covers all statistical units related to energy production and consumption. The statistical population in the Emirate of Abu Dhabi consists of several populations that vary according to the statistics and data collected.

It covers all households residing in the Emirate of Abu Dhabi, residents residing in the Emirate, establishments in relevant economic sectors that consume fossil fuels of various types such as gasoline, diesel, natural gas, or other fuels, as well as establishments engaged in the production of crude oil and refined petroleum products.

2.7. Statistical unit

Statistical units refer to the basic units from which data are collected and analyzed for the purpose of producing statistical indicators. In the context of energy statistics, the statistical unit includes the individual, the household, establishments that consume various types of fossil fuels, and establishments engaged in the production of crude oil and refined petroleum products.

These units enable the measurement and understanding of different aspects of the energy sector and provide an accurate and comprehensive picture of the sector in the Emirate, as well as support the analysis of its patterns and trends.

2.8. Geographical coverage

Geographical coverage for the energy statistics includes the three regions in the Emirate of Abu Dhabi: Abu Dhabi, Al Ain, and Al Dhafra.

2.9. Unit of measure

Energy statistics are presented using specific measurement units based on the nature of each indicator, to ensure data clarity and ease of analysis. The main units include the following:

Percentage (%): to measure Proportion of population with primary reliance on clean fuels and technology, Share of household income spent on fuel and electricity, Proportion of population with access to electricity.

Billion British thermal unit (BBTU): to measure Total fossil fuel combustion, Fossil fuel combustion by sector – gasoline, Fossil fuel combustion by sector – diesel, Fossil fuel combustion by sector - natural gas, Fossil fuel combustion by sector – other.

Kilowatt Hour (KWh): to measure quantity of residential electricity consumption per household, Net electricity use per household, Energy Savings per Household.

Megawatt Hour (MWh): to measure Quantity of electricity consumption per capita, Quantity of residential electricity consumption per capita.

Thousand Barrel: Production of crude oil, Daily production of crude oil.

Thousand Metric Ton: Production of refined petroleum products, Production of refined petroleum products by product type, Daily production of refined petroleum products, Crude oil inputs for petroleum refining products.

Emirati Dirham (AED): to measure Total energy expenditure per household, Gas expenditure per household, Petroleum expenditure per household, Electricity expenditure per household.

These units contribute to standardizing data presentation and ensuring comparability, which enhances the accuracy of analysis and the effectiveness of using indicators in decision-making.

2.10. Reference period

The reference period for the data of all energy statistics is the previous year.

2.11. Timeliness

All energy statistics are issued for all users within 12 months after the reference period

2.12. Frequency of dissemination

Energy statistics in the Emirate of Abu Dhabi are collected and published on an annual basis, ensuring the provision of accurate and up-to-date data that reflect the actual status of the energy sector in terms of production and consumption. This regular reporting cycle enables the monitoring of changes in the sector's key indicators, supports policymakers in understanding trends, strategic planning, and decision-making based on reliable information.

2.13. Data Time Series

The time series for the energy statistics in the Emirate of Abu Dhabi covers varying time periods, reflecting the development of data collection and indicator calculation, as well as the expansion of their scope over the years starting from 2005 to 2026.

2.14. Abu Dhabi Special Considerations

It should be noted that Abu Dhabi is one of the seven emirates, which imposes certain limitations on data collection and interpretation. However, since the sources used to collect energy statistics data also operate at the emirate level, this should not be a factor affecting the quality of the data.

3. Statistical processing

3.1. Data sources

Energy statistics rely on administrative data collected from departments, in addition to survey data regularly conducted by the statistics center of Abu Dhabi. These data contribute to the production of reliable statistical indicators covering the various aspects related to the energy sector.

3.1.1. Survey data

Energy statistics rely on data collected from periodic surveys conducted by the Abu Dhabi Statistics Center, following approved statistical methodologies to ensure accuracy and reliability.

These surveys include the Yearly environment survey, which provides data on fossil fuel consumption (gasoline, diesel, natural gas, and others) across various sectors.

While Household income and expenditure survey provide information on the population relying primarily on clean fuels and technology and those with access to electricity services, in addition to the household electricity consumption and the household expenditure on the various types of energy including gas, petroleum, and electricity as percentage of the household income.

3.1.2. Administrative data

Energy statistics rely on administrative data collected annually by government entities and companies.

These entities include the Department of Energy, which provides data on the quantity of electricity consumption and residential electricity consumption.

The Abu Dhabi National Oil Company provides data including crude oil production, production of refined petroleum products, and crude oil used as input in the production of refined petroleum products.

The calculation of indicators such as Quantity of residential electricity consumption per household, Quantity of electricity consumption per capita, Quantity of residential electricity consumption per capita, and Energy Savings per Household are based on population data from the register-based census and is calculated by Statistics Centre – Abu Dhabi.

3.2. Data validation and editing

3.2.1. Data validation

The process of validating and editing raw data is of great importance, as it forms the foundation for subsequent statistical analysis. The Statistics Centre – Abu Dhabi implements various measures to ensure data accuracy and high-quality standards. All required data is verified to be complete and compliant with the Centre’s requirements. Data is audited to ensure that errors are identified, addressed, and properly documented. Data is also checked for consistency with statistical definitions and classifications, and outliers are reviewed, and data logic is verified, as well as comparing current data with historical time series to ensure logical consistency in results and trends.

SCAD implements the following types of data editing in specific cases:

- **Validity and completeness of data:** The validity of the data refers to the correctness of the responses/entries, based on the possible options (number, percentage, etc.).
- **Range:** The range sets the minimum and maximum expected values of the variable.
- **Duplicate data entry:** Verifying that the data of each unit of the register or the database was entered only once, with no duplication.
- **Logical consistency:** Consistency is the presence of logical relationships and interdependence between the variables. This type of editing considers the connection between data fields or variables.
- **Outliers:** This type of editing follows other checks and is used for the detection of extreme values, based on the distribution of the current data and previous data series, which makes it easier to detect the values that can be considered unusual or extreme, so that they can be checked and verified.

3.2.2. Missing data adjustments

Handling missing data is a fundamental step to ensure the quality and accuracy of energy statistics. Regarding administrative data, the providing entity works to supply data that is as complete as possible before submitting it to Statistics Centre – Abu Dhabi.

Administrative data are carefully reviewed during collection and processing, and corrective actions are taken in cases of missing or inconsistent information, either through communication with the source

entity or by verifying time series data. This approach helps minimize data gaps and ensure the completeness of records, thereby enhancing the reliability of the results produced by this methodology.

As for survey data, missing data is reviewed and completed in the field during data collection. Various statistical methods are employed to estimate missing and outlier data, including:

- Imputation using predefined values: These values are determined based on the logical relationships between variables.
- Nearest-neighbor imputation (kNN): This method selects the value that is most similar to the missing one in terms of characteristics.
- Stochastic imputation: This method estimates missing values by randomly selecting them from a suitable probability distribution or from similar cases.

3.3. Statistical Calculation Method

The Calculation methods used in energy statistics ensure accuracy and consistency in data analysis and reporting. These calculations include the following:

- **Proportion of population with access to electricity:** $[\text{Number of populations with access to electricity} \backslash \text{Total number of populations}] \times 100$.
- **Quantity of residential electricity consumption per household:** $[\text{Total quantity of residential electricity consumption} \backslash \text{Total Households}]$
- **Quantity of residential electricity consumption per capita:** $[\text{Quantity of residential electricity consumption} \backslash \text{Population estimates} - \text{annually}]$.
- **Quantity of electricity consumption per capita:** $[\text{Quantity of electricity consumption} \backslash \text{Population estimates} - \text{annually}]$.
- **Net electricity use per household:** $[\text{Total amount of electricity consumed by households} \backslash \text{Total number of households}]$.
- **Share of household income spent on fuel and electricity:** $[\text{Total household expenditures on fuel and electricity} \backslash \text{Total households' income}] \times 100$.
- **Total energy expenditure per household:** $[\text{Total household energy expenditure} \backslash \text{Total number of households}]$.
- **Gas expenditure per household:** $[\text{Total household gas expenditure} \backslash \text{Total number of households}]$.
- **Petroleum expenditure per household:** $[\text{Total household petroleum expenditure} \backslash \text{Total number of households}]$.
- **Electricity expenditure per household:** $[\text{Total household electricity expenditure} \backslash \text{Total number of households}]$.

- **Energy Savings per Household:** [Average energy consumption per household in the baseline period - Average actual energy consumption per household in this year].
- **Proportion of population with primary reliance on clean fuels and technology:** [Total population using clean fuels and technologies for cooking, heating and lighting\ Total number of population] x 100.
- **Total fossil fuel combustion:** [Fossil fuel combustion by sector - gasoline + Fossil fuel combustion by sector - diesel + Fossil fuel combustion by sector - natural gas + Fossil fuel combustion by sector – other]
- **Fossil fuel combustion by sector – gasoline:** The total amount of gasoline consumed in operating engines and equipment in addition to any other consumption classified in the Emirate of Abu Dhabi.
Broken down by sector
- **Fossil fuel combustion by sector – diesel:** The total amount of diesel consumed in operating engines and equipment in addition to any other consumption classified in the Emirate of Abu Dhabi.
Broken down by sector
- **Fossil fuel combustion by sector – natural gas:** The total amount of natural gas consumed in operating engines and equipment in addition to any other consumption classified in the Emirate of Abu Dhabi.
Broken down by sector
- **Fossil fuel combustion by sector – other:** The total amount of 'other' fossil fuel consumed in operating engines and equipment in addition to any other consumption classified in the Emirate of Abu Dhabi.
Broken down by sector
- **Production of crude oil:** Total quantity of crude oil production in the Emirate of Abu Dhabi.
- **Daily production of crude oil:** [Production of crude oil\ Number of days in reference year].
- **Crude oil inputs for petroleum refining products:** Total quantity of crude oil inputs for petroleum refining products in the Emirate of Abu Dhabi.
- **Production of refined petroleum products:** Total quantity of refined petroleum products production in Abu Dhabi Emirate.
- **Daily production of refined petroleum products:** [Production of refined petroleum products\ Number of days in reference year].

These calculations contribute to generating accurate indicators that reflect reality of energy sector in the Emirate of Abu Dhabi, supporting strategic decision-making.

3.4. Seasonal Adjustment

No seasonal adjustment is made to the energy statistics, which are collected and calculated annually.

4. Methodology changes

Methodological changes related may occur in line with changes in quality assurance processes, auditing, organizational structures, and applicable regulations. The methodology can also be adjusted considering factors such as policy objectives and the relevance of the indicator. However, no recent changes have been made to the methodology related to the energy statistics.

5. Revision policy

The process of continuous data improvement is mandatory to ensure the accuracy of the data and statistical products provided by the Statistics Centre – Abu Dhabi. This includes reviewing official statistics published through printed documents or approved dissemination channels. The policy defines the general rules for reviewing and publishing statistics, informing users of potential reasons for revisions, classifying improvements, and documenting all aspects of the review. This framework allows producers to determine review mechanisms based on specific characteristics. The improvement policy covers all statistics and time series with varying time periods.

Additionally, the Statistics Centre – Abu Dhabi publishes a general data revision policy that applies to all statistics under its responsibility, ensuring adaptability to the unique characteristics of different statistics and allowing specialized improvement policies in line with the general policy.

6. Statistical quality

The quality of statistical data focuses on the concept of (data relevance for use) by preparing statistical data characterized by a set of traits and properties that meet and align with the data requirements of users and decision-makers. Thus, statistical quality exists within an institutional environment that is characterized by professionalism, integrity, and neutrality, closely related to the set objectives for the data and the needs of users. This is achieved through the use of a clear, standardized framework that ensures the data's reliability, realism, comparability, efficiency, accessibility, and flexibility, and that it is available to all within an appropriate timeframe and in an easily accessible and usable manner.

Statistical product quality reports are prepared by the Quality Team in SCAD.

7. Appendix (1)

S.V. Code	Statistical Value (En)	اسم المؤشر
2303	Quantity of residential electricity consumption per household	نصيب الأسرة من كمية استهلاك الكهرباء المنزلي
2385	Fossil fuel combustion by sector - gasoline	الوقود الأحفوري المستهلك حسب القطاع - جازولين
2386	Fossil fuel combustion by sector - diesel	الوقود الأحفوري المستهلك حسب القطاع - ديزل
2387	Fossil fuel combustion by sector - other	الوقود الأحفوري المستهلك حسب القطاع - أخرى
2384	Total fossil fuel combustion	إجمالي كمية الوقود الأحفوري المستهلك
4073	Fossil fuel combustion by sector - natural gas	الوقود الأحفوري المستهلك حسب القطاع - الغاز الطبيعي
2433	Production of refined petroleum products	إنتاج المنتجات النفطية المكررة
2434	Production of refined petroleum products by product type	إنتاج المنتجات النفطية المكررة حسب نوع المنتج
2436	Daily production of refined petroleum products	الإنتاج اليومي للمنتجات النفطية المكررة
2383	Crude oil inputs for petroleum refining products	النفط الخام المستخدم كمادة أولية في إنتاج المنتجات النفطية المكررة
2011	Production of crude oil	إنتاج النفط الخام
2012	Daily production of crude oil	الإنتاج اليومي للنفط الخام
2016	Net electricity use per household	صافي استهلاك الكهرباء لكل أسرة
2017	Total energy expenditure per household	إجمالي إنفاق الطاقة لكل أسرة

S.V. Code	Statistical Value (En)	اسم المؤشر
2018	Gas expenditure per household	إنفاق الغاز لكل أسرة
2019	Petroleum expenditure per household	إنفاق البترول لكل أسرة
2020	Electricity expenditure per household	إنفاق الكهرباء لكل أسرة
2021	Energy Savings per Household	توفير الطاقة لكل أسرة
2056	Proportion of population with primary reliance on clean fuels and technology	نسبة السكان الذين يعتمدون بشكل أساسي على الوقود النظيف والتكنولوجيا
2262	Share of household income spent on fuel and electricity	حصة الإنفاق على الوقود والكهرباء من دخل الأسرة
3804	Proportion of population with access to electricity	نسبة السكان الذين يحصلون على الكهرباء
2481	Quantity of electricity consumption per capita	نصيب الفرد من كمية استهلاك الكهرباء
2478	Quantity of residential electricity consumption per capita	نصيب الفرد من كمية استهلاك الكهرباء المنزلي
