1. Introduction

Population statistics provide an overview of the size, composition, and geographic distribution of the resident population in the Emirate of Abu Dhabi and its changes over time. These statistics support the analysis of demographic trends and serve as a key input for economic and social planning.

In this context, the Statistics Centre – Abu Dhabi (SCAD) compiles and disseminates official population statistics to ensure the availability of consistent, reliable, and standardized demographic data for government entities, researchers, and other data users.

This methodology document describes the statistical framework used to produce population statistics, which are derived from population census data combined with observed demographic components of change, namely fertility, mortality, and migration. SCAD applies the cohort component method to calculate end year resident population statistics disaggregated by age, gender, citizenship, and region, in line with internationally recognized demographic practices.

SCAD also produces population projections on an annual basis using analytical assumptions about future demographic trends. Unlike population statistics, projections are forward looking and are not classified as official statistics. This distinction is maintained to ensure transparency and correct interpretation of population output.

2. Statistical Information

2.1. Importance and Objectives

Population statistics are fundamental for understanding demographic dynamics in terms of population size, composition, and spatial distribution, as well as changes over time resulting from natural change and migration. They provide the basis for compiling and interpreting a wide range of economic and social indicators, enabling meaningful comparisons across time and geographic areas.

These statistics form a key evidence base for planning, monitoring, and evaluating public policies and development strategies. Population statistics are widely used to support resource allocation, service planning, and assessment of demographic phenomena such as population ageing, fertility, mortality, urbanization, and migration. Accurate population statistics contribute to more effective planning across sectors including housing, education, health, transport, and infrastructure, while inaccurate or missing estimates may lead to inefficient decision-making and misallocation of resources.

Population statistics also underpin the production of derived demographic and socio-economic indicators, such as dependency ratios, and serve as essential denominators for rates and ratios, sampling frames for surveys, and weighting of survey results.

The key objectives of population statistics are to:

- Provide reliable, timely, and high-quality demographic data on the resident population of Abu Dhabi
- Support evidence-based policy formulation, planning, and evaluation
- Enable the calculation of population-based indicators, rates, and ratios

- Support the planning and provision of public services, including health, education, housing, and infrastructure
- Serve as a statistical framework for surveys, studies, and official statistical publications

2.2. Key Outputs

The main output of population statistics in the Emirate of Abu Dhabi consist of a set of key indicators across different population domains, including:

1. **Households**
2. **Population**
3. **Resident Population**

2.3. Concepts and Definitions

The concepts and definitions used are those approved by the Statistics Centre – Abu Dhabi, aligned with internationally recognized terminology. These include the following:

- **Usual Resident:** Usual resident population: Individuals who usually reside in the Emirate of Abu Dhabi for a period of six months or more or who intend to reside there during the census period, including both Emirati and non-Emirati nationals. The census includes the population residing in the Emirate of Abu Dhabi, regardless of where their identification documents were issued in the country. This includes Emiratis residing in the Emirate of Abu Dhabi, Emiratis whose identification documents are issued in other emirates and usually reside in the Emirate of Abu Dhabi, non-Emiratis who have spent at least six months during the reference period of 12 months in the Emirate, and non-Emiratis intending to reside in the Emirate permanently, or for a period of no less than six months.
- **Total Population:** The census population comprising all usual residents, regardless of legal status or citizenship.
- **Total Population Estimate:** The estimated population of all usual residents for a specified reference date.
- **Final Population Estimates:** The final population estimates that are referenced to a particular date are made when all the data necessary to make final estimates is available. It is done after the completion of the census process and after the specified reference date. Final estimates may be referred to as “final” on the tables. The absence of any indication that the estimates are preliminary or revised means that they are final estimates.
- **Preliminary Population Estimates:** Population estimates produced after the reference date using the best available data before all required information is finalized. Preliminary estimates are subject to revision.

- **Revised Population Estimates:** Population estimates that update previously released preliminary estimates using additional or revised information before the production of the final estimates.
- **Population Growth Rate:** The average annual rate of change in the population during a specified period, resulting from natural increase and migration.

2.4. Classifications and standards applied

The Statistics Centre – Abu Dhabi (SCAD) compiles population statistics in accordance with internationally recognized definitions, classifications, and methodological standards. In particular, SCAD applies international guidelines for defining the usual resident population and for deriving population statistics from census data.

Population statistics are primarily produced using the cohort component method, which is applied separately for citizens and non citizens. Revised population estimates are based on observed demographic data, while preliminary estimates may rely on extrapolated inputs where complete data are not yet available, in line with international demographic estimation practices.

The main international references applied in the production of population estimates include:

- Methods for Population Projections by Sex and Age (United Nations)
- Principles and Recommendations for Population and Housing Censuses (United Nations)
- The Methods and Materials of Demography (Second Edition) by Siegel and Swanson

2.5. Available Breakdown

The Statistics Centre – Abu Dhabi publishes a wide range of population statistics indicators. These are disseminated according to the following breakdowns:

Age breakdown:

- 0 - 4
- 5 - 9
- 10 - 14
- 15 - 19
- 20 - 24
- 25 - 29
- 30 - 34
- 35 - 39
- 40 - 44
- 45 - 49
- 50 - 54
- 55 - 59

- 60 - 64
- 65 - 69
- 70 - 74
- 75 - 79
- 80+

Single year of age breakdown to 85+ is available, for special calculations, but not intended to be published.

Gender breakdown:

- Male
- Female

Citizenship Breakdown:

- Citizen
- Non-citizen

Region Breakdown:

- Abu Dhabi
- Al Ain
- Al Dhafra

2.6. Statistical Population

The statistical population for population estimates includes all usual residents of the Emirate of Abu Dhabi. This covers UAE citizens and non-citizens whose place of usual residence is within the Emirate, across the three regions of Abu Dhabi, Al Ain, and Al Dhafra.

Usual residents comprise individuals who have stayed or intend to stay continuously in the Emirate for at least six months, including UAE citizens temporarily outside the country but normally residing in Abu Dhabi. Short-term visitors and non-resident populations are excluded, in accordance with internationally recommended definitions.

This broad coverage ensures that population estimates accurately reflect the demographic structure of the Emirate and provide a consistent basis for analysis, planning, and the derivation of population-based indicators.

2.7. Statistical Unit

The statistical unit for population estimates refers to the individual person, classified as a usual resident of the Emirate of Abu Dhabi. Data are collected and compiled at the individual level and may be aggregated according to demographic, household, or geographic characteristics depending on the indicator and analytical purpose.

2.8. Geographic Coverage

Geographical coverage includes the three regions in the Emirate of Abu Dhabi: Abu Dhabi, Al Ain, and Al Dhafra.

2.9. Unit of Measure

The Statistics Centre – Abu Dhabi publishes population statistics indicators using standardized measurement units, depending on the nature of each indicator. Population estimates are disseminated using standardized measurement units appropriate to demographic indicators. The primary unit of measure is the **number of persons**, representing the size of the resident population.

Depending on the indicator, additional measurement units may include:

- **Counts:** People, number, households
- **Rates and proportions:** Percentage (%)
- **Density measures:** People per square kilometer
- **Demographic ratios:** Children per employed mother, child per household
- **Time:** Years
- **Monetary values:** Emirati Dirham (AED), where population measures are linked to economic indicators

2.10. Reference Period

The reference period for population statistics varies by indicator. Data are compiled based on different reference periods, including the previous calendar year, calendar month, quarter, or six-month period, depending on the nature and frequency of the indicator.

2.11. Timeliness

Population estimates are produced and released on a regular basis to ensure timely access to key demographic information. Mid-year, end-year, and mid-quarter population estimates are compiled and disseminated annually in accordance with the established production schedule.

Revised mid-year population estimates are published with reference to the mid-year. For years following the most recent population census (post-censal period), the objective is to produce the most reliable mid-year population estimates within six months after the end-year reference date, or within twelve months after the mid-year reference date.

2.12. Frequency of Dissemination

Population statistics are disseminated on a regular basis, with most indicators released annually and selected indicators published on a quarterly basis.

2.13. Data Time Series

The length of the available time series for population statistics varies by indicator. Data for different indicators is available from different starting years, beginning as early as 2007 and extending to recent years up to 2026.

This variation in the starting year of coverage reflects differences in the timing of data availability, data collection practices, and the inclusion of each indicator within the statistical production system.

2.14. Abu Dhabi Special Considerations

It should be noted that Abu Dhabi is an emirate and one of 7 emirates in UAE, therefore certain limitations apply in collecting and obtaining data. The population estimates, however, are prepared for the Emirate of Abu Dhabi and administrative data are available specifically for the Abu Dhabi Emirate. Therefore, data compilation can be considered as accurate as otherwise for a national state and is not subject to any constraints.

Furthermore, inter-emirate migration presents a challenge to SCAD in collecting accurate and timely population statistics. Given that there is no physical border separating the emirate of Abu Dhabi from the others, no data is collected when an individual crosses out of and into the emirate.

3. Statistical Processing

3.1. Data Source

Population estimates are compiled using census data, survey data, and administrative records to ensure comprehensive coverage and reliability. Census data provide the benchmark for population levels and structure, while survey and administrative data support the estimation of demographic components of change.

The Labour Force Survey (LFS) is used to support migration estimation, particularly through information on place of usual residence one year ago, contributing to estimates by age, gender, citizenship, and region. Administrative data are obtained from relevant government entities, including the Department of Health – Abu Dhabi, the Department of Education and Knowledge – Abu Dhabi, and Abu Dhabi Airports Company, and are transferred to the Statistics Centre – Abu Dhabi (SCAD) for processing and classification. These data are used to estimate births, deaths, and migration, which form the basis for resident population estimates. SCAD has previously relied on data from the Federal Authority for Identity, Citizenship, Customs and Port Security and is exploring the reintegration of this source.

In addition, SCAD uses a Population Register as an integrated administrative source to enhance the quality, consistency, and completeness of population estimates.

3.1.1. Survey Data

The population census is the primary source for compiling population statistics; however, it is supplemented with estimation methods to support the production of population estimates between census periods. The census integrates three data collection approaches: administrative records, self-counting, and field counting.

The census represents a comprehensive process of collecting, classifying, processing, analyzing, and disseminating statistical data on the size, distribution, and demographic, social, and economic characteristics of the population within the boundaries of the Emirate for a specified reference period, in line with the United Nations definition.

Stages and outputs of the survey:

1. **Administrative records:** Accounting for the resident population based on the demographic and social characteristics available from administrative records by linking the household database and housing administrative records with individual administrative identity records.
2. **Self-counting and field counting:** Completing the population data inventory through self-counting using available channels, such as web pages and email. Population data not covered through administrative records or self-counting are subsequently identified and collected through fieldwork.
3. **Coverage assessment:** Providing the necessary data to calculate population coverage and coverage levels and to support the assessment of the accuracy and reliability of the census data.

Scope of the census

The census scope defines the categories of statistical units that are included in the census counting process, as well as those that are outside the scope of the census. This distinction ensures that the population and other statistical units covered by the census are clearly identified and that the resulting data provide a comprehensive and reliable representation of the population within the Emirate.

Collection method

The following data collection methods and sources are used by SCAD:

- Census through field interviews.
- Register-based census.
- Labour Force Survey (LFS).
- Government registers obtained directly from Abu Dhabi or UAE administrative records.
- International sources, where relevant, such as the U.S. Energy Information Administration (EIA).

The Abu Dhabi Census covers the entire Emirate and does not use sampling. In the 2011 Census, different questionnaires were used for different respondent categories; households were administered a long questionnaire, while workers' camps were covered using a shorter questionnaire. Following the 2011 Census, sample surveys were conducted to collect data items not captured through the census.

3.1.2. Administrative Data

SCAD uses various administrative data sources for population estimates. The main administrative and supplementary data sources include:

- **Birth and death records:** Birth and death records are obtained from the Department of Health – Abu Dhabi
- **Labor Force Survey and economic data:** Estimates of inbound migration are obtained from the Labor Force Survey, including information on the “place of usual residence one year ago.” Worker compensation data by economic activity at current prices are also used as an input to estimate in-migration through multiple regression models. The in-migration estimates derived from the Labor Force Survey are used as one of the inputs for estimating non-citizen in-migration. Due to the relatively low mobility of citizens, citizen in-migration is estimated using additional administrative and economic indicators.
- **Education enrolment data:** Education enrolment data are obtained from Department of Education and Knowledge (ADEK). Total enrolments of male citizen pupils are used as one independent variable for the citizen in-migration multiple regression model. Enrolment data by age, gender, citizenship, and region, are used to calibrate the population estimates for the school age population.
- **International passenger data:** Data on incoming and outgoing international passengers are obtained from Abu Dhabi Airports Company and are used to support the estimation of international migration.
- **Federal Authority for Identity and Citizenship (ICA):** ICA data were previously considered a key source for information on international migration for the UAE and Abu Dhabi. However, these data are no longer shared with SCAD and are therefore not currently available as an input to the population estimates.

The administrative and supplementary data are transferred to SCAD for processing, classification, validation, and analysis. The resulting information is used to estimate the components of population change, including births, deaths, and migration. These components are subsequently incorporated into the population estimation process to produce estimates of the resident population.

3.2. Data Validation and Editing

3.2.1. Data Validation

The validation and editing process of raw data is important as it constitutes the basis for subsequent statistical analysis. SCAD implements various measures to ensure data accuracy and high-quality standards. All required data is verified for completeness and compliance with the Centre’s requirements. Administrative data is regularly audited to detect, address, and properly document any errors. Data consistency with statistical definitions and classifications is verified, outliers are reviewed, and the logical coherence of the data is checked.

Population statistics data are reviewed and edited in relation to previous years and the data associated therewith, checking logic by considering both internal (relationships, structure and correlations within the dataset) and external consistency (data supplied in previous years and other data associated therewith).

In some cases, automated rules embedded in electronic data capturing platforms are also used to detect errors or determine unacceptable responses/entries. Reports on the errors are then submitted to the relevant parties.

SCAD may also implement or require government entities to implement the following types of data editing in specific cases, as is also outlined in the Statistical Data Editing Guide:

- **Validity and completeness of data:** The validity of the data refers to the correctness of the responses/entries, based on the possible options (number, percentage, etc.).
- **Range:** The range sets the minimum and maximum expected values of the variable.
- **Duplicate data entry:** Verifying that the data of each unit of the register or the database was entered only once, with no duplication, especially when there are variations in some index fields of the unit within the record.
- **Logical consistency:** Consistency is the presence of logical relationships and interdependence between the variables. This type of editing considers the connection between data fields or variables.
- **Outliers:** This type of editing follows other checks and is used for the detection of extreme values, based on the distribution of the current data and previous data series, which makes it easier to detect the values that can be considered unusual or extreme, so that they can be checked and verified.

3.2.2. Missing Data Adjustments

The Statistical Data Quality Framework for Abu Dhabi outlines the quality standards which SCAD is committed to achieve, whether the source of such data is statistical surveys or administrative records. The framework seeks to create a unified understanding of statistical quality for all entities in the Statistical System in the Emirate of Abu Dhabi (SSAD), which will enable these entities to prepare consistent mechanisms and procedures in order to monitor, evaluate and develop the statistical quality of its administrative and survey data.

Furthermore, the Manual of Statistical Quality Standards and Procedures for Administrative Records presents key standards and procedures to ensure the statistical quality of administrative records data. The manual, which is consistent with adopted international and local standards, outlines and describes the following quality dimensions: 1) organizational structure; 2) relevance; 3) clarity of administrative records preparation methodology; 4) accuracy; 5) coherence and consistency; 6) accessibility; and 7) timeliness, periodicity and punctuality.

3.3. Statistical Calculation Method

The population estimates are produced using four main calculation techniques. These four techniques are referred to as Cohort Component, Exponential Interpolation, Ratio-Share of Growth and Linear Interpolation. Cohort Component is the primary method, Exponential Interpolation is the secondary method, Ratio-Share of Growth is the tertiary method and Linear Interpolation is the quaternary method.

The end-year population estimates of residents are calculated using the population accounting equation (also called the population balancing equation). This simple component method consists of adding natural increase and net migration to the last population estimate. Natural increase is accounted for by adding births and subtracting deaths, and administrative records are used to estimate these components of population change. Net migration is accounted for by adding in-migration to and subtracting out-migration from Abu Dhabi Emirate, and various data sources are used to estimate migration. These four components of population change are applied to each of the four control total populations – male citizens, female citizens, male non-citizens, and female non-citizens.

The population accounting equation method enables annual intercensal or post census variations of population growth to be captured in the population estimates. Changes in the components of population growth (births, deaths, and migration) are reflected in the population estimates.

The age structure of the population is calculated using the cohort component method. This method applies the principles of the population accounting equation to each of the four-control population by single year of age for one-year intervals.

Cohort component

The cohort component method is the preferred demographic method for population estimates if all the relevant input data are available. The basic equations for the cohort component method for 1-year estimates applied over 1-year periods are: For population age below 1:

$$P_0^{t+1} = B - D_{-1} + I_{-1} - E_{-1}$$

For population age 1 year and over:

$$P_{a+1}^{t+1} = P_a^t - D_a + I_a - E_a$$

where,

P = the estimated population

B = births

D = deaths

E = the number of out-migrants

I = the number of in-migrants

0 = infants (less than one year of age)

a = age of the event as of the reference date

t = reference date (end-year)

-1 = the risks of a 0-year-old after birth.

Summarized into four control totals by aggregating all age groups the cohort component method is equivalent to the Population Accounting Equation:

$$P_{t+1} = P_t + B - D + I - E$$

This Population Accounting Equation is calculated for four Emirate level control totals (usual residents by citizenship and gender).

The population accounting equation results in four control populations at Emirate level as of 31 December of each year (end-year).

To apply the cohort component method, when reliable data on components of growth are lacking, estimates are prepared for the components of growth (fertility, mortality, and migration) for the four control totals (above) by single year of age. For intercensal years, the estimates are constrained to match census year estimates.

The cohort component method results in single year of age (with final age group 85+) population estimates for each of the four control populations at Emirate level on 31 December of each year (end-year).

The cohort component method is used for each population estimates and for population projections. The difference is that for population estimates “actual” values for the component of population growth are used, and for projections assumptions about the inputs are used. For example, the population estimates use registered births (adjusted for a slight undercount) and population projections use assumed Total Fertility Rate applied to an assumed age schedule of birth by age of mother applied to projected females.

Exponential interpolation and extrapolation

This method combines the change in all components of growth (fertility, mortality, and migration) into one measure (population growth rate). The method assumes a constant growth rate between measuring points (for example between two base years or between two end-years).

This method is preferred with lack of reliable data on components of growth. The geometric growth curve with population growth compounded continuously can be described with the exponential function:

$$P_t = P_0 e^{rt}$$

where,

P_0 = the initial population

t = the period over which growth occurs

r = the growth rate (added continuously)

e = the base of the system of natural logarithms

P_t = the population at time t

The geometric growth curve can also be described with the compound interest formula:

$$P_t = P_0 (1 + r)^t$$

In the first formula the r represents the growth rate added continuously to the population. In the second 'compound interest' formula the r represents the average annual growth rate.

This method is used to calculate mid-year population estimates by interpolation between two end-year population estimates. Exponential interpolation is calculated for four Emirate level control totals (usual residents by citizenship and gender).

The result of the exponential interpolation is mid-year estimates of the four control populations. By using exponential interpolation, the mid-year population estimates are similar (but not exactly) to an average population of that year, and therefore less subject to volatility in the estimates.

Ratio-share of growth

The Ratio-Share of Growth method refers to a calculation of the population change in each area which is then expressed as a ratio of the total population change. The sum of all ratio-shares is therefore always 100% (or 1.000). The basic equation for the ratio-share of growth method is:

For sub-area A in total area T:

$$R_A = \frac{P_A^{t+1} - P_A^t}{P_T^{t+1} - P_T^t}$$

where,

R_A = ratio-share of sub-area A

P_A = population in area A

P_T = population in total area T

t = 31 December of the previous year

$t+1$ = 31 December of the year of calculation

The ratio-shares of growth can then be forecasted by simple linear extrapolation (see below) or scaled to other symptomatic variables to estimate future growth trends if other symptomatic variables are available. The ratio-share of growth method has been proven accurate in empirical studies where population growth is moderate or high and reasonably evenly distributed across areas of study. However, it should be used with caution, because it can result in unacceptable results when the overall population growth is small, and some areas have negative population growth.

This ratio-share of growth method is applied to region level control totals for usual residents by citizenship and gender.

The result is then constrained to the Emirate level control totals.

The Ratio-Share of Growth method results in total population estimates at the regional level (3 regions) for the four control populations as of 30 June each year (mid-year).

Linear interpolation and extrapolation

The linear change function assumes that the population will change with the same number of persons over a given period. For example, exponential interpolation assumes that the population grow with a fixed percentage each year, and linear interpolation that population grow with a fixed number of persons each year.

The advantage of linear interpolation is for calculation at more than one dimension. For linear interpolation the sum of the interpolated components will add to the same amount as the control totals. The equation for linear interpolation can be written as:

$$\Delta = \frac{P_t - P_0}{y_t - y_0}$$

where,

Δ = average population change

P_t = population at interpolation end year

P_0 = population in the base year

$y_t - y_0$ = is the number of years in the period from the base year to the end year

To deal with the effect of migration on the age distribution, linear interpolation of age groups is used for regional age calculations up to mid-year 2011. Linear extrapolation is also used to forecast some input variables for the calculation with cohort component method, such as age specific rates. The result is constrained to the control totals derived from Population Accounting Equation and Exponential Interpolation and Extrapolation

The result of linear interpolation and extrapolation is, therefore, only used in intermediate calculations and none of the numbers presented as population estimates have been calculated with linear interpolation alone.

They key highlights for Intercensal, Base year and Post censal estimates are:

1. Intercensal population estimates

- Intercensal population estimates are produced for each year between 31 December population estimates in census years (base years), resulting in end-year population estimates for each year. The control totals are calculated with the population accounting equation each year. The midyear population estimates are calculated with exponential interpolation between two consecutive end-years, matching four control totals in base years.
- The age structure is calculated with cohort component method for end-year population estimates. The age structure for mid-year population estimates is calculated with linear interpolation at single year of age, constrained to control totals using exponential interpolation (described above).
- These calculations are done at the Emirate level. Regional population estimates are calculated with the Ratio-Share of Growth method.

2. Post censal population estimates

- Post censal population estimates at Emirate level are produced for each year with reference date 31 December. The end-year population control totals are calculated with the population accounting equation each year.
- The mid-year population estimates are calculated with exponential interpolation between two consecutive end-years. Annual variations in population growth due to variations in the component of population growth (fertility, mortality, and migration) are captured through the end-year estimates. The calculations result in a time series of estimated resident population in Abu Dhabi Emirate for 30 June each year for the four control populations.
- The age structure is calculated with cohort component method for end-year population estimates. The age structure for mid-year population estimates is calculated with linear interpolation at single year of age, constrained to control totals using exponential interpolation.
- These calculations are done at the Emirate level. Regional population estimates are calculated with the Ratio-Share of Growth method constrained to the Emirate level population estimates.

3. Base year population estimates

- A base year population is the mid-year population estimate in a census year. Adjustments are made for population change that occurred between the reference dates of the census and the mid-year.
- The input data for the calculation of a base year population is the census count of the same year and adjustment factors derived from the net undercount assessment.
- The census counts used for the calculation have been cleaned. Internal and external consistency checks have been done to the census count, and the required micro and macro edits have been performed to correct the census count for detected errors.
- A coverage study is undertaken. A set of adjustment factors have been calculated to represent the net undercount in the census.
- The base year population is then calculated by taking the census count, adjusting it for the net undercount, adjusting for age-heaping (age digit preferences), and adjusting for the components of change (births, deaths, and migration) that occurred in the period between the census and the mid-year.

Preliminary, revised, and final population estimates

The estimates of the resident population in Abu Dhabi Emirate for 30 June each year (mid-year) are first released as preliminary, then as revised, and after the next census result the estimates are released as final. Revisions of the population estimates can be more than once or not at all, depending on availability of the new data and the influence this new information has on the population estimates.

Preliminary population estimates are produced for a reference date at a point in time after the reference date but before all relevant input data are available or finalized. Preliminary population estimates are subject to revision.

Revised population estimates are updates of preliminary population estimates for a reference date at a point in time after the reference date and are produced when new information is obtained but before all input data for final population estimates are available or finalized.

When new information becomes available population estimates that are preliminary can be revised, resulting in either a new revised estimate or a final estimate. Revised estimates may also be revised again before final estimates are available. Final population estimates are produced for a reference date when all data used to make the estimates are final. This usually follows the finalization of the Census following the reference date.

Migration Estimates

Since the ICA has stopped being a source of international travel data for SCAD and there are no data sources on inter-emirate migration, this method is a necessary substitute.

The migration model used to calculate annual migration flows separately estimates the total flows for in-migrants and out-migrants by citizenship. The citizen in-migration model is a linear regression model with two predictor variables. The non-citizen in-migration model is a linear regression model with three predictor variables. The citizen out-migration model is based on age-specific probabilities of out-migration of the resident citizen population. The non-citizen out-migration model is based on return migration probabilities by duration of stay. The gender dimension is estimated with sex ratios of in-migrants, and for out-migrants the calculation is done separately by gender, and no sex ratio estimates are needed. The age dimension for in-migration is calculated with age-specific age profiles by single-year of age, citizenship, and gender. For out-migration it is calculated with out-migration transition probabilities by single year of age, unconstrained for citizens and constrained to migration model control totals.

To calculate the migration model, SCAD uses the following regression model for citizens:

$$M_t = a + v_1 * b_1 + v_2 * b_2$$

where:

M_t = total citizen in-migration in calendar year t

t = the period over which migration occurs

A = a constant parameter calculated with GLS

v_1 = annual change in compensation of employees in services activities (lagged one year)

b_1 = a fixed coefficient calculated with GLS

v_2 = annual change in enrolment of male pupils (in the school year ending that year)

b_2 = a fixed coefficient calculated with GLS

The regression model formula for non-citizens can be described with the following function:

$$M_t = a + v_1 * b_1 + v_2 * b_2 + v_3 * b_3$$

where:

Mt = total non-citizen in-migration in calendar year t
t = the period over which migration occurs
A = a constant calculated with GLS
v1 = average of 'migration estimates' and 'issued work visas * 0.36'
b1 = a fixed coefficient calculated with GLS
v2 = oil revenue in US \$ (lagged 3 years)
b2 = a fixed coefficient calculated with GLS
v3 = total non-citizen employment change
b3 = a fixed coefficient calculated with GLS

The intercensal migration estimates, used as inputs to design the method described above, were calculated for both net international and internal migration combined by age groups, sex and citizenship by surviving the population by age, sex and citizenship in the census before last to the corresponding population by age-sex-citizenship groups from the last census (using survival rates obtained from a Life Table constructed for the mid-intercensal period) then subtracting the number of survivors from the corresponding number from the last census to get the estimated number of net migrants (net international and internal migrants combined). In addition, the net migration is split into estimates of in-migrants and out-migrants by single year or age, gender, and citizenship, which are manually adjusted to match the final population estimates derived from the last census. The control total is the calculated intercensal net migration.

3.4. Seasonal Adjustment

Seasonally adjusted estimates are not produced for this publication.

4. Methodology Changes

Geographical change

The number of regions enumerated in censuses in recent decades has changed from two regions (Abu Dhabi and Al Ain) to four regions (Abu Dhabi, Al Ain, Western Region and Emirates Islands) to currently three regions (Abu Dhabi Region, Al Ain Region and Al Dhafra).

Changes of calculation method over time

In 2009 and 2010, exponential interpolations (and extrapolation) were conducted between census reference dates and constrained to the calculation of a total population. In 2011, minor changes to methodology were introduced. To avoid anomalies in census years, the population estimates were calculated from mid-year estimates in census years (base year population estimates), and four control totals were used instead of one.

In 2012, cohort component method was introduced to calculate the age structures by gender, citizenship, and region for the base year (2011) only. The adjustment made to shift the population estimate from the census reference date to the mid-year reference date was done by cohort component method. However, these age structures calculated with cohort component method were constrained to control totals calculated with exponential interpolation.

SCAD changed the methodology for population estimates from an exponential interpolation and extrapolation method to the population accounting equation method in 2013, because better administrative records and other information allows for better population estimates to be produced with the population accounting equation. The preliminary mid-year 2012 estimates were the last estimates produced using the exponential interpolation and extrapolation method. The preliminary mid-year and end-year estimates for 2013 used the cohort component method. The currently available final mid-year population estimates 2006 to 2010, and the revised mid-year population estimates from 2011 onwards are calculated with the cohort component method.

5. Revision Policy

Continuous data refinement is mandated to ensure the accuracy of data and statistical products provided by the Statistics Centre – Abu Dhabi. This involves revising official statistics published through printed documents or approved dissemination channels. The policy outlines general rules for reviewing and publishing statistics, informing users of potential review reasons, categorizing refinements, and documenting all review aspects. This framework allows producers to determine review mechanisms based on specific characteristics. The refinement policy covers all indicators, statistics, and time series of varying periodicities. Additionally, the Statistics Centre – Abu Dhabi publishes a general data refinement policy applicable to all statistics under its responsibility, ensuring adaptability to the distinct characteristics of various statistics and allowing for specialized refinement policies in alignment with the general policy.

6. Statistical Quality

The quality of statistical data focuses on the concept of (data relevance for use) by preparing statistical data characterized by a set of traits and properties that meet and align with the data requirements of users and decision-makers. Thus, statistical quality exists within an institutional environment that is characterized by professionalism, integrity, and neutrality, closely related to the set objectives for the data and the needs of users. This is achieved through the use of a clear, standardized framework that ensures the data's reliability, realism, comparability, efficiency, accessibility, and flexibility, and that it is available to all within an appropriate timeframe and in an easily accessible and usable manner.

Statistical product quality reports are prepared by the Quality Team in SCAD.

7. Appendix Table

S.V. Code	Indicator Name	اسم المؤشر
8750	Total Population - Annually	إجمالي السكان - سنوي
8751	Total Population - Quarterly	إجمالي السكان - ربع سنوي
8752	Population by Region - Annually	السكان حسب المنطقة - سنوي
8753	Population by Region - Quarterly	السكان حسب المنطقة - ربع سنوي
8755	Population by Citizenship - Annually	السكان حسب الجنسية - سنوي
8756	Population by Citizenship - Quarterly	السكان حسب الجنسية - ربع سنوي
8757	Population by Gender - Annually	السكان حسب النوع - سنوي

8758	Population by Gender - Quarterly	السكان حسب النوع - ربع سنوي
8759	Population by Age Group - Annually	السكان حسب الفئة العمرية - سنوي
8760	Population by Age Group - Quarterly	السكان حسب الفئة العمرية - ربع سنوي
8765	Population by Religion	السكان حسب الديانة
8763	Population by Education Attainment	السكان حسب التحصيل العلمي
8762	Population by Country Group	السكان حسب مجموعة الدول
8770	Population by Region and Citizenship	السكان حسب المنطقة والجنسية
8769	Population by Region and Age Group	السكان حسب المنطقة والفئة العمرية
8764	Population by Region and Gender	السكان حسب المنطقة والنوع
8754	Population by Urban and Rural Regions	السكان حسب المناطق الحضرية والريفية
8776	Population by Citizenship, Gender and Marital Status	السكان حسب الجنسية، النوع والحالة الزوجية
8772	Population by Age, Citizenship, Gender and Region	السكان حسب العمر، الجنسية، النوع والمنطقة
8775	Population by Region, Citizenship, Gender and Age Group	السكان حسب المنطقة، الجنسية، النوع والفئة العمرية
8382	Population by Region, Citizenship, Gender and Age Group - Quarterly	السكان حسب المنطقة، الجنسية، النوع والفئة العمرية - ربع سنوي
8773	Population by Region, District, Citizenship and Gender	السكان حسب المنطقة، المنطقة الفرعية، الجنسية والنوع
8771	Population by Region, Gender and Wide Age Group	السكان حسب المنطقة، النوع، الفئة العمرية العريضة
8774	Population by Region, Citizenship, Gender, Age Group and Marital Status	السكان حسب المنطقة، الجنسية، النوع، الفئة العمرية والحالة الزوجية
8743	Daytime Population	السكان في النهار
8766	School-Age Population (6-18)	السكان في سن الدراسة (6-18) سنة
8767	Working-Age Population (15-64)	السكان في سن العمل (15-64) سنة
8749	Population of Early Retirees	السكان المتقاعدين مبكراً
8640	Population in Household by Region, Citizenship, Gender and Age Group - Annually	السكان في الأسر حسب المنطقة، الجنسية، النوع والفئة العمرية - سنوي
8383	Population in Household by Region, Citizenship, Gender and Age Group - Quarterly	السكان في الأسر حسب المنطقة، الجنسية، النوع والفئة العمرية - ربع سنوي
3916	Population estimates - annually	تقديرات السكان - سنوي
4483	Population estimates - quarterly	تقديرات السكان - ربع سنوي
3175	Population estimates by region - annually	تقديرات السكان حسب المنطقة - سنوي
4487	Population estimates by region - quarterly	تقديرات السكان حسب المنطقة - ربع سنوي
3917	Population estimates by citizenship - annually	تقديرات السكان حسب الجنسية - سنوي
4484	Population estimates by citizenship - quarterly	تقديرات السكان حسب الجنسية - ربع سنوي
3919	Population estimates by gender - annually	تقديرات السكان حسب النوع - سنوي
4486	Population estimates by gender - quarterly	تقديرات السكان حسب النوع - ربع سنوي
4485	Population estimates by age group	تقديرات السكان حسب الفئة العمرية

3551	Population estimates by citizenship and gender	تقديرات السكان حسب الجنسية والنوع
7740	Population Estimates by Age, Citizenship, Gender and Region	تقديرات السكان حسب العمر، الجنسية، النوع والمنطقة
3918	Population estimates by region, citizenship, gender and age group	تقديرات السكان حسب المنطقة، الجنسية، النوع والفئة العمرية
3550	Population estimates by region, citizenship, gender, age group and marital status	تقديرات السكان حسب المنطقة، الجنسية، النوع، الفئة العمرية والحالة الزوجية
3628	Population estimates by region, district, citizenship and gender	تقديرات السكان حسب المنطقة، المنطقة الفرعية، الجنسية والنوع
3178	Population density estimates by region	تقديرات الكثافة السكانية حسب المنطقة
3921	Estimate of proportion of Emirati population	تقديرات نسبة السكان الإماراتيين
8761	Proportion of Population by Age Group	نسبة السكان حسب الفئة العمرية
8768	Proportion of Working-Age Population (15-64)	نسبة السكان في سن العمل (15-64) سنة
8777	Proportion of Population by Citizenship, Gender and Marital Status	نسبة السكان حسب الجنسية، النوع والحالة الزوجية
3920	Population growth rate by region	معدل نمو السكان حسب المنطقة
4114	Population growth rate by citizenship	معدل نمو السكان حسب الجنسية
3002	Population growth rate by gender	معدل نمو السكان حسب النوع
3001	Population growth rate by region, citizenship and gender	معدل نمو السكان حسب المنطقة، الجنسية والنوع
7399	Emiratis holding Abu Dhabi Emirate Family Book by age group	الإماراتيون حملة خلاصة قيد إمارة أبوظبي حسب الفئة العمرية
6870	Emiratis holding Abu Dhabi Emirate Family Book by household monthly income	الإماراتيون حملة خلاصة قيد إمارة أبوظبي حسب الدخل الشهري للأسرة
7155	Emiratis holding Abu Dhabi Emirate Family Book by marital status	الإماراتيون حملة خلاصة قيد إمارة أبوظبي حسب الحالة الزوجية
6869	Emiratis holding Abu Dhabi Emirate Family Book by number of children, their gender and age group	الإماراتيون حملة خلاصة قيد إمارة أبوظبي حسب عدد الأبناء، نوعهم والفئة العمرية
7156	Emiratis holding Abu Dhabi Emirate Family Book by residential unit tenure type	الإماراتيون حملة خلاصة قيد إمارة أبوظبي حسب نوع حيازة الوحدة السكنية
7161	Emiratis holding Abu Dhabi Emirate Family Book by region	الإماراتيون حملة خلاصة قيد إمارة أبوظبي حسب المنطقة
6872	Growth rate of Emiratis holding Abu Dhabi Emirate Family Book by region	معدل نمو الإماراتيين حملة خلاصة قيد إمارة أبوظبي حسب المنطقة
7403	Married Emiratis holding Abu Dhabi Emirate Family Book by number of wives	الإماراتيون المتزوجون حملة خلاصة قيد إمارة أبوظبي حسب عدد الزوجات
8604	Registered Non-Emirati Individuals in the Emirate of Abu Dhabi by Religion	الأفراد غير الإماراتيين المسجلين في إمارة أبوظبي حسب الديانة
8643	Registered Non-Emirati Individuals in the Emirate of Abu Dhabi by Religion and Region	الأفراد غير الإماراتيين المسجلين في إمارة أبوظبي حسب الديانة والمنطقة

8645	Registered Non-Emirati Individuals in the Emirate of Abu Dhabi by Religion and District	الأفراد غير الإماراتيين المسجلين في إمارة أبوظبي حسب الديانة والمنطقة الفرعية
8646	Non-Emirati Residents in the Emirate of Abu Dhabi by Religion	الأفراد غير الإماراتيين المقيمين في إمارة أبوظبي حسب الديانة
8642	Non-Emirati Residents in the Emirate of Abu Dhabi by Religion and Region	الأفراد غير الإماراتيين المقيمين في إمارة أبوظبي حسب الديانة والمنطقة
8644	Non-Emirati Residents in the Emirate of Abu Dhabi by Religion and District	الأفراد غير الإماراتيين المقيمين في إمارة أبوظبي حسب الديانة والمنطقة الفرعية
8675	Registered Non-Married Individuals (30 years and above) in the Emirate of Abu Dhabi	الأفراد غير المتزوجين (30 سنة فأكثر) المسجلين في إمارة أبوظبي
8678	Registered Non-Married Individuals (30 years and above) in the Emirate of Abu Dhabi by Citizenship	الأفراد غير المتزوجين (30 سنة فأكثر) المسجلين في إمارة أبوظبي حسب الجنسية
8680	Registered Non-Married Individuals (30 years and above) in the Emirate of Abu Dhabi by Age Group	الأفراد غير المتزوجين (30 سنة فأكثر) المسجلين في إمارة أبوظبي حسب الفئة العمرية
8676	Registered Non-Married Individuals (30 years and above) in the Emirate of Abu Dhabi by Gender	الأفراد غير المتزوجين (30 سنة فأكثر) المسجلين في إمارة أبوظبي حسب النوع
8673	Non-Married Residents (30 years and above) in the Emirate of Abu Dhabi	الأفراد غير المتزوجين (30 سنة فأكثر) المقيمين في إمارة أبوظبي
8677	Non-Married Residents (30 years and above) in the Emirate of Abu Dhabi by Citizenship	الأفراد غير المتزوجين (30 سنة فأكثر) المقيمين في إمارة أبوظبي حسب الجنسية
8679	Non-Married Residents (30 years and above) in the Emirate of Abu Dhabi by Age Group	الأفراد غير المتزوجين (30 سنة فأكثر) المقيمين في إمارة أبوظبي حسب الفئة العمرية
8674	Non-Married Residents (30 years and above) in the Emirate of Abu Dhabi by Gender	الأفراد غير المتزوجين (30 سنة فأكثر) المقيمين في إمارة أبوظبي حسب النوع
7393	Proportion of females aged (18-49) who don't have children by region, marital status and citizenship	نسبة الإناث (18-49) سنة اللاتي ليس لديهن أبناء حسب المنطقة، الحالة الزوجية والجنسية
7398	Average number of children (18 years and less) in the households	متوسط عدد الأبناء (18 سنة فأقل) للأسر
6859	Children (18 years and less) per employed mother	معدل الأبناء (18 سنة فأقل) لكل أم مشغلة
7395	Divorced and Widowed Emirati Fathers by Number of Children	الآباء الإماراتيين المطلقين والأرامل حسب عدد الأبناء
6861	Divorced and Widowed Emirati Mothers by Number of Children	الأمهات الإماراتيات المطلقات والأرامل حسب عدد الأبناء
7392	Revenue for Golden Residency Holders - Annually	إيرادات حاملي الإقامة الذهبية - سنوي
3027	Proportion of the rural population who live within 2 km of an all-season road	نسبة سكان الريف الذين يعيشون على بعد كيلومتريين من طريق صالحة للاستعمال في جميع الفصول

3803	Proportion of urban population living in slums, informal settlements, or inadequate housing	نسبة السكان الحضريين الذين يعيشون في أحياء فقيرة أو مستوطنات غير رسمية أو مساكن غير لائقة
8785	Total Households - Annually	إجمالي الأسر - سنوي
8786	Total Households - Quarterly	إجمالي الأسر - ربع سنوي
8787	Households by Region - Annually	الأسر حسب المنطقة - سنوي
8788	Households by Region - Quarterly	الأسر حسب المنطقة - ربع سنوي
8809	Households by Household Type - Annually	الأسر حسب نوع الأسرة - سنوي
8810	Households by household type - Quarterly	الأسر حسب نوع الأسرة - ربع سنوي
8789	Average Household Size by Household Type - Annually	متوسط حجم الأسرة حسب نوع الأسرة - سنوي
7397	Distribution of Households by number of children (18 years and less)	توزيع الأسر حسب عدد الأبناء (18 سنة فأقل)
8660	Registered Households in the Emirate of Abu Dhabi by Household Type	الأسر المسجلة في إمارة أبوظبي حسب نوع الأسرة
8662	Registered Households in the Emirate of Abu Dhabi by Citizenship and Region	الأسر المسجلة في إمارة أبوظبي حسب الجنسية والمنطقة
8664	Registered Households in the Emirate of Abu Dhabi by Citizenship and District	الأسر المسجلة في إمارة أبوظبي حسب الجنسية والمنطقة الفرعية
8659	Resident Households in the Emirate of Abu Dhabi by Household Type	الأسر المقيمة في إمارة أبوظبي حسب نوع الأسرة
8661	Resident Households in the Emirate of Abu Dhabi by Citizenship and Region	الأسر المقيمة في إمارة أبوظبي حسب الجنسية والمنطقة
8663	Resident Households in the Emirate of Abu Dhabi by Citizenship and District	الأسر المقيمة في إمارة أبوظبي حسب الجنسية والمنطقة الفرعية
8669	Single-Parents Households by Region	الأسر أحادية الوالد حسب المنطقة
8672	Single-Parents Households by Number of Children (18 years and less)	الأسر أحادية الوالد حسب عدد الأبناء (18 سنة فأقل)
8670	Single-Parents Households by Gender of Head of Household	الأسر أحادية الوالد حسب نوع رب الأسرة
8671	Single-Parents Households by Gender of Head of Household and Citizenship	الأسر أحادية الوالد حسب نوع رب الأسرة والجنسية
8681	Proportion of Emirati Households with a Female Head of Household - Annually	نسبة الأسر الإماراتية التي تترأسها امرأة - سنوي
8707	Proportion of Emirati Households with a Female Head of Household - Quarterly	نسبة الأسر الإماراتية التي تترأسها امرأة - ربع سنوي
8683	Proportion of Emirati Households with Female Head of Household Who Have Dependent Children (15 years and less) - Annually	نسبة الأسر الإماراتية التي تترأسها امرأة ولديها أطفال معالون (15 سنة فأقل) - سنوي
8684	Proportion of Emirati Households with Female Head of Household Who Have Dependent Children (15 years and less) - Quarterly	نسبة الأسر الإماراتية التي تترأسها امرأة ولديها أطفال معالون (15 سنة فأقل) - ربع سنوي

8685	Proportion of Emirati Households with Female Head of Household Who Have Dependent Senior Emiratis (60 years and above) - Annually	نسبة الأسر الإماراتية التي تترأسها امرأة ولديها كبار مواطنين معالين (60 سنة فأكثر) - سنوي
8686	Proportion of Emirati Households with Female Head of Household Who Have Dependent Senior Emiratis (60 years and above) - Quarterly	نسبة الأسر الإماراتية التي تترأسها امرأة ولديها كبار مواطنين معالين (60 سنة فأكثر) - ربع سنوي
8599	Average Number of Children (18 years and less) in Registered Households in the Emirate of Abu Dhabi	متوسط عدد الأبناء (18 سنة فأقل) للأسر المسجلة في إمارة أبوظبي
8602	Average Number of Children (18 years and less) in Registered Households in the Emirate of Abu Dhabi by Citizenship	متوسط عدد الأبناء (18 سنة فأقل) للأسر المسجلة في إمارة أبوظبي حسب الجنسية
8600	Average Number of Children (18 years and less) in Registered Households in the Emirate of Abu Dhabi by Region	متوسط عدد الأبناء (18 سنة فأقل) للأسر المسجلة في إمارة أبوظبي حسب المنطقة
8658	Average Number of Children (18 years and less) in Registered Households in the Emirate of Abu Dhabi by District	متوسط عدد الأبناء (18 سنة فأقل) للأسر المسجلة في إمارة أبوظبي حسب المنطقة الفرعية
8641	Average Number of Children (18 years and less) in Registered Households in the Emirate of Abu Dhabi by Abu Dhabi Family Book	متوسط عدد الأبناء (18 سنة فأقل) للأسر المسجلة في إمارة أبوظبي حسب خلاصة قيد إمارة أبوظبي
8597	Average Number of Children (18 years and less) in Resident Households in the Emirate of Abu Dhabi	متوسط عدد الأبناء (18 سنة فأقل) للأسر المقيمة في إمارة أبوظبي
8601	Average Number of Children (18 years and less) in Resident Households in the Emirate of Abu Dhabi by Citizenship	متوسط عدد الأبناء (18 سنة فأقل) للأسر المقيمة في إمارة أبوظبي حسب الجنسية
8598	Average Number of Children (18 years and less) in Resident Households in the Emirate of Abu Dhabi by Region	متوسط عدد الأبناء (18 سنة فأقل) للأسر المقيمة في إمارة أبوظبي حسب المنطقة
8657	Average Number of Children (18 years and less) in Resident Households in the Emirate of Abu Dhabi by District	متوسط عدد الأبناء (18 سنة فأقل) للأسر المقيمة في إمارة أبوظبي حسب المنطقة الفرعية
8603	Average Number of Children (18 years and less) in Resident Households in the Emirate of Abu Dhabi by Abu Dhabi Emirate Family Book	متوسط عدد الأبناء (18 سنة فأقل) للأسر المقيمة في إمارة أبوظبي حسب خلاصة قيد إمارة أبوظبي
8605	Divorced Emirati Women ('Talaq Ba'inah Sughra') for Three and More Years Who Have Children Holding Abu Dhabi Emirate Family Book	الإناث الإماراتيات المطلقات (طلاق بائن بينونة صغرى) منذ ثلاث سنوات أو أكثر ولديهن أبناء حملة خلاصة قيد إمارة أبوظبي
8606	Divorced Emirati Women ('Talaq Ba'inah Kubra') Who Have Children Holding Abu Dhabi Emirate Family Book	الإناث الإماراتيات المطلقات (طلاق بائن بينونة كبرى) اللاتي لديهن أبناء حملة خلاصة قيد إمارة أبوظبي
8716	Widowed Population by Gender	الأرامل حسب النوع

8717	Widowed Population by Citizenship	الأرامل حسب الجنسية
8718	Widowed Population by Age Group	الأرامل حسب الفئة العمرية
8719	Widowed Population by Region	الأرامل حسب المنطقة
8748	Average Age of Widowed Population by Region	متوسط عمر الأرامل حسب المنطقة
8778	Population Average Age	متوسط عمر السكان
8779	Population Median Age	وسيط عمر السكان
8780	Population of People of Determination	السكان من أصحاب الهمم
8781	Population of People of Determination by Age Group	السكان من أصحاب الهمم حسب الفئة العمرية
8782	Population of People of Determination by Gender	السكان من أصحاب الهمم حسب النوع
8783	Population of People of Determination by Region	السكان من أصحاب الهمم حسب المنطقة
8784	Population Density	الكثافة السكانية
8639	Population in Labour Camp by Region, Citizenship, Gender and Age Group - Quarterly	السكان في معسكرات العمال حسب المنطقة، الجنسية، النوع والفئة العمرية - ربع سنوي
8595	Population in Labour Camp by Region, Citizenship, Gender and Age Group - Annually	السكان في معسكرات العمال حسب المنطقة، الجنسية، النوع والفئة العمرية - سنوي
8617	Polygamy Families	العائلات متعددة الزوجات
8618	Polygamy Families by Region	العائلات متعددة الزوجات حسب المنطقة
8620	Polygamy Families by District	العائلات متعددة الزوجات حسب المنطقة الفرعية
8621	Polygamy Families by Number of Wives	العائلات متعددة الزوجات حسب عدد الزوجات
8619	Polygamy Families by Region and Citizenship	العائلات متعددة الزوجات حسب المنطقة والجنسية
9486	Proportion of Emiratis Aged (15-34) not in Education or Employment	نسبة الإماراتيين (15-34) سنة غير الملتحقين بالعمل أو التعليم
8746	Population of Children of Emirati Mothers	السكان من أبناء الأمهات الإماراتيات
3684	Population residing in the Emirate of Abu Dhabi by economic activity status, citizenship and gender - annually	السكان المقيمون في إمارة أبوظبي حسب حالة النشاط الاقتصادي، الجنسية والنوع - سنوي
4503	Population residing in the Emirate of Abu Dhabi by economic activity status, citizenship and gender - quarterly	السكان المقيمون في إمارة أبوظبي حسب حالة النشاط الاقتصادي، الجنسية والنوع - ربع سنوي
3163	Departures Permanently Through the Ports of the Emirate of Abu Dhabi	المغادرون بشكل نهائي عبر منافذ إمارة أبوظبي
3925	Departures Permanently Through the Ports of the Emirate of Abu Dhabi by Gender	المغادرون بشكل نهائي عبر منافذ إمارة أبوظبي حسب النوع
3922	Departures Permanently Through the Ports of the Emirate of Abu Dhabi by Citizenship	المغادرون بشكل نهائي عبر منافذ إمارة أبوظبي حسب الجنسية
3923	Departures Permanently Through the Ports of the Emirate of Abu Dhabi by Port	المغادرون بشكل نهائي عبر منافذ إمارة أبوظبي حسب المنفذ

3924	Departures Permanently Through the Ports of the Emirate of Abu Dhabi by Age Group	المغادرون بشكل نهائي عبر منافذ إمارة أبوظبي حسب الفئة العمرية
1565	Departures Permanently Through the Ports of the Emirate of Abu Dhabi by Citizenship, Destination and Type of Residence	المغادرون بشكل نهائي عبر منافذ إمارة أبوظبي حسب الجنسية، الوجهة ونوع الإقامة
3168	New Arrivals for Residency Purposes Through the Ports of the Emirate of Abu Dhabi	القادمون الجدد بهدف الإقامة عبر منافذ إمارة أبوظبي
3173	New Arrivals for Residency Purposes Through the Ports of the Emirate of Abu Dhabi by Gender	القادمون الجدد بهدف الإقامة عبر منافذ إمارة أبوظبي حسب النوع
3172	New Arrivals for Residency Purposes Through the Ports of the Emirate of Abu Dhabi by Citizenship	القادمون الجدد بهدف الإقامة عبر منافذ إمارة أبوظبي حسب الجنسية
3170	New Arrivals for Residency Purposes Through the Ports of the Emirate of Abu Dhabi by Port	القادمون الجدد بهدف الإقامة عبر منافذ إمارة أبوظبي حسب المنفذ
3171	New Arrivals for Residency Purposes Through the Ports of the Emirate of Abu Dhabi by Age Group	القادمون الجدد بهدف الإقامة عبر منافذ إمارة أبوظبي حسب الفئة العمرية
3169	New Arrivals for Residency Purposes Through the Ports of the Emirate of Abu Dhabi by Type of Entry Visa	القادمون الجدد بهدف الإقامة عبر منافذ إمارة أبوظبي حسب نوع تأشيرة الدخول
1564	New Arrivals for Residency Purposes Through the Ports of the Emirate of Abu Dhabi by Citizenship, Country of Arrival and Type of Entry Visa	القادمون الجدد بهدف الإقامة عبر منافذ إمارة أبوظبي حسب الجنسية، بلد القدوم ونوع التأشيرة
3934	Residents by Type of Residence	المقيمون حسب نوع الإقامة
3933	Number of Active Entry Visas	عدد تأشيرات الدخول المفعلة
3058	Number of Active Entry Visas by Type of Visa	عدد تأشيرات الدخول المفعلة حسب نوع التأشيرة
